AB The present invention relates to a stable pharmaceutical composition of cefpodoxime proxetil (I), for oral administration. A tablet contained I 49.79, **calcium** CM-cellulose 42.07, lactose 3.64, hydroxypropyl cellulose 1.64, sodium lauryl sulfate 2.05, and **magnesium** stearate 0.82%. The amount of I released in glycine buffer after 10 min was 88.8%.

AB The present invention provides compns. and methods for increasing absorption of antibacterial agents, particularly third generation cephalosporin antibacterial agents, in oral dosage solid and/or suspension forms. Specifically, the composition is comprised of a **biopolymer** that is preferably swellable and/or mucoadhesive, an antimicrobial agent, and a cationic binding agent contained within the **biopolymer** such that the binding agent is ionically bound or complexed to at least one member selected from the group consisting of the **biopolymer** and the antimicrobial agent. A solution of 44.5 mg **calcium** chloride in 10 mL water and 1.0 g of **ceftriaxone** in 10 mL water was added gradually to a solution of 400 mg **carrageenan** and the dispersion was centrifuged and the supernatant was lyophilized. The resulting composition comprized **carrageenan** 27.7, **ceftriaxone** 1, and **calcium** chloride 3.1%. Plasma concentration of different antimicrobial-**biopolymer** complexes after oral administration to rats was measured.

AB Cefpodoxime proxetil (CPDX-PR), an orally-active cephalosporin antibiotic, possesses one asym. carbon atom in the ester group and exists as a mixture of two amorphous diastereoisomers, CPDX-PR (A) and CPDX-PR (B). There are marked differences in the dissoln. behavior of CPDX-PRs (A) and (B). Although the dissolved amount of CPDX-PR(A) increases with time to reach equilibrium rapidly, CPDX-PR (B) exhibits supersatd. phenomena in strongly-acidic conditions. Super-saturated solns. of CPDX-PR(B) remain as clear solns. at first, but finally transform into gels. From elec. microscope data, it was revealed that spherical particles of crystalline CPDX-PR(B) HCl salt adhere together to constitute the framework of the gel and solution occupies gaps in the framework of the gel. CPDX-PR model tablets formulated a disintegrant with comparably low swelling pressure, exhibited decreased dissoln. in strongly-acidic conditions. A gel layer formed at the surface of the tablets must inhibit water penetration into the inner part of the tablets. Thus, the tablets disintegrate slowly, resulting in poor dissoln. However, formulation of a disintegrant having excellent swelling behavior was revealed to improve both the delayed disintegration and the decreased dissoln. of CPDX-PR tablets. The tablets with the improved dissoln. behavior apparently exhibited higher in vivo bioavailability in beagle dogs than that with the decreased dissoln. due to gel formation.

DOCUMENT TYPE: Journal
LANGUAGE: English

AB The compatibility of doxorubicin hydrochloride liposome injection with selected other drugs during simulated Y-site administration was studied. Five milliliters of doxorubicin hydrochloride liposome injection 0.4 mg/mL in 5% dextrose injection was combined with 5 mL of each of 82 other drugs in 5% dextrose injection or, if necessary to avoid incompatibilities with the diluent, 0.9% sodium chloride injection. The combinations were examined with the unaided eye in fluorescent light and in high-intensity monodirectional light to enhance visualization of small particles and low-level turbidity. The turbidity of each combination was measured as well. Particle sizing and counting were performed on selected combinations. Evaluations were performed initially and at one and four hours. All combinations were stored at room temperature (.apprx.23 °C). Most of the test drugs were compatible with doxorubicin hydrochloride liposome injection during the four-hour observation period. However, practitioners should be cautious in administering any drug simultaneously

with doxorubicin hydrochloride liposome injection until the integrity of the liposomes can be verified. Eighteen drugs exhibited unacceptable increases or decreases in measured turbidity or particulate formation within four hours. During simulated Y-site administration, doxorubicin hydrochloride 0.4 mg/mL (as the liposomal injection) in 5% dextrose injection was compatible with 64 of 82 other drugs for four hours at .apprx.23 °C and was incompatible with 18 of the test drugs.

AB Cefpodoxime proxetil (CPDX-PR) has been developed as a racemate and only one of the two diastereoisomers forms a gel in strongly acidic conditions. CPDX-PR model tablets, formulated with a disintegrant with low swelling pressure, exhibited decreased dissoln. in strongly acetic conditions. These phenomena were explained by formation of a gel layer at tablet surface, inhibiting water penetration into the inner part of the tablets. Thus, the tablets are slow to disintegrate, resulting in poor dissoln. However, formulation with a disintegrant having excellent swelling behavior improved both the delayed disintegration and the decreased dissoln. of CPDX-PR tablets. Tablets with the improved dissoln. behavior apparently exhibited higher in vivo bioavailability in beagle dogs than those with the decreased dissoln. due to gel formation.

AB A nonconventional liposome composition consisting of nonphospholipid lipids, especially cholesterol and cholesterol ester salts, are used for encapsulation of drugs. They are useful for sustained release of steroids, and are suitable for treatment of inflammatory, arthritic, rheumatoid diseases, etc., especially as aerosols for interstitial lung disease. Beclomethasone dipropionate (I) 10 was incorporated into liposomes prepared with Na cholesterol sulfate 50 and cholesterol 40 mol %. Sustained release of I was observed in rats following intratracheal administration, in contrast to liposomes formulated with phosphatidylcholine and cholesterol.

AB The absorptions of liposol. salicylic acid, water-soluble vitamin B6, **ceftriaxone**, the quinolone antibacterial norfloxacin and anticancer doxorubicin were discussed by using, **liposome** as biomembrane model and comparison with cell membrane. The absorption of salicylic acid whose absorption curve is linear depends on the passive diffusion. The exptl. result of vitamin B6 supports the opinion that the absorption of vitamin B6 depends on proteins which lie in membranes. The absorption of vitamin B6 is a chem. process, so absorption curve is nonlinear. The absorption mode of **ceftriaxone** is a simple diffusion. The absorption of norfloxacin depends on the effects of **metal** ions. Under the driving force of nucleic acid in cells, doxorubicin was absorbed through biomembrane.

DOCUMENT TYPE: Journal
LANGUAGE: English

AB Cefpodoxime proxetil is an **orally** active, broad spectrum, third generation cephalosporin ester. This prodrug was previously found to be hydrolyzed in vitro both in rabbit and human duodenal washing by a cholinesterase. The objective of this work was to find a formulation which can protect the prodrug from enzymic attack. In order to protect the prodrug from enzymic hydrolysis, the objective was to include it into the oil phase of an oil-in-water (o/w) emulsion. Somehow, cefpodoxime proxetil posed specific problems related to the solubilization. The solubilization was obtained with a mixed medium-chain-triglycerides (MCT)/blends of mono-, di- and triglycerides oil phase and the optimal

ratio was defined to be 60:40 (weight/weight) in order to obtain emulsification.
The emulsifier was a soybean lecithin alone or in mixts. with Polysorbate 20. This nonionic surfactant was chosen since it was found to directly inhibit the hydrolysis of cefpodoxime proxetil in vitro using duodenal washings. The o/w submicron emulsions were be effective in protecting the prodrug from enzymic attack in rabbit duodenal washings compared with a micellar solution and an aqueous solution of cefpodoxime proxetil. An o/w submicron
emulsion incorporating Polysorbate 20 was e the most protective, which can corroborate the inhibitory role of Polysorbate itself.
IT **9005-64-5**, Polysorbate 20 **9005-70-3**, Polysorbate 85
RL: THU (Therapeutic use); BIOL (Biological study); USES (Uses)
(**cefpodoxime**-proxetil protection from intestinal lumen hydrolysis by oil-in-water submicron emulsions)

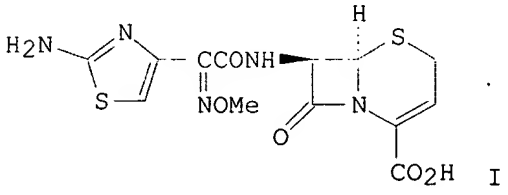
GI



I

AB The **oral** bioavailability of **ceftizoxime** Na (I Na) [**68401-82-1**] was improved by formulations containing Et cellulose [9004-57-3] and medium-chain triglycerides (Miglyol 812), as compared with aqueous solns. of I. A formulation containing 500 mg I Na, 5.0 mL medium-chain triglyceride, and 200 mg Et cellulose gave a larger area under the curve and higher urinary excretion of I than a formulation containing 50 mg Et cellulose instead of 200 mg. The urinary excretion of I was 7.1-10.3% when **polyethylene glycol**, olive oil, or H2O was used as the vehicle, as compared to 16.2-37.7% when the triglyceride + Et cellulose or olive oil + Et cellulose was used as the vehicle. Serum concns. attained exceeded the min. inhibitory concns. for most bacterial pathogens.
